Global Product Data Interoperability Summit | 2021

Matt Heying

Vice President of Product, Vertex Software

- BSME / MSME **Iowa State University**
- Grad Work (2003-2008) DARPA/ONR Grant on Machine Learning Models and 3D Visualization for Accelerated Insertion of Materials at Virtual Reality Applications Center (VRAC)
- **Workiva** (2008-2018) - VP of Product - built the first ever B2B Cloud SaaS on Google Cloud Platform
- **Vertex** (2018-Present) - Vertex VP of Product

Leveraging your 3D Product Data throughout your organization

Global Product Data Interoperability Summit | 2021

- **Sales:** Shorten sales cycle through enhanced customer engagement
- **Manufacturing:** shop-floor MBD, increase factory yield and improve defect reporting and resolution
- **Service:** drive parts and service revenue, reduce customer downtime
- **Engineering:** Shorten design cycles by improving collaboration among engineering teams and suppliers
- **Customers:** customer experiences with interactive digital twins connected to live data sources

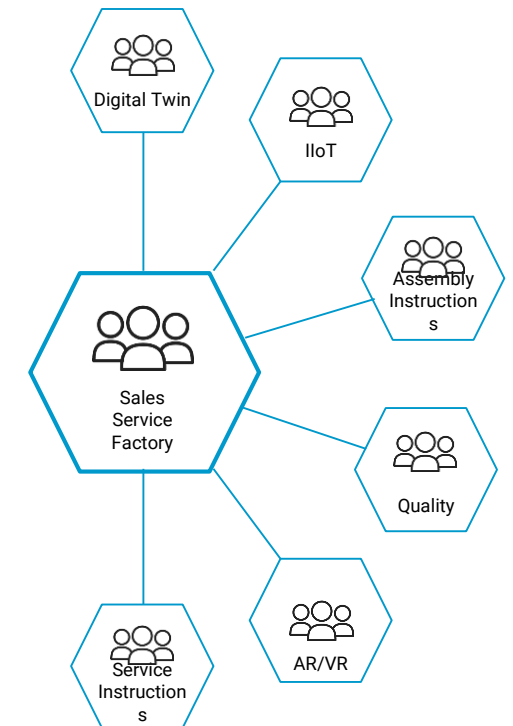

Leveraging your 3D Product Data throughout your organization

Global Product Data Interoperability Summit | 2021

Conventional Method: Client-side Rendering

Global Product Data Interoperability Summit | 2021

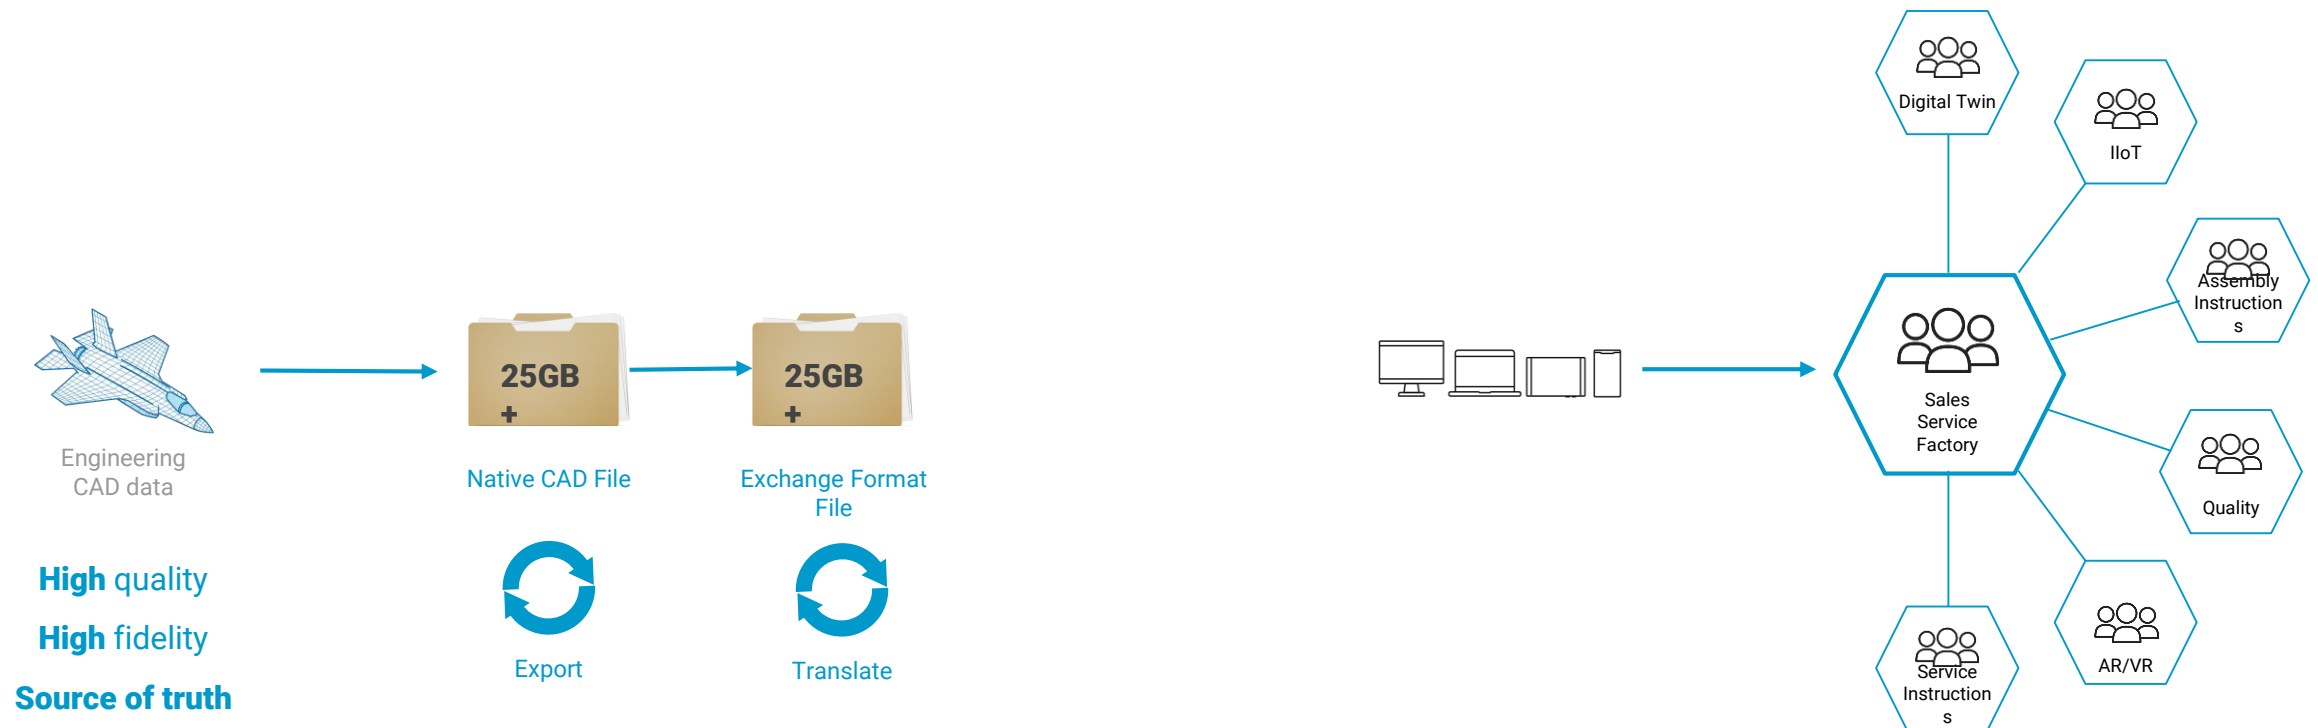

Conventional Method: Client-side Rendering

Global Product Data Interoperability Summit | 2021

Client-side Rendering:

- Stream Assets (geometry) to device
- File-based
- Levels of Detail Management
- Render on device with OpenGL / Vulkan / WebGL etc
- Performance Implications (device hardware, load time etc)
- Security Implications (how sensitive are your triangles?)

Cloud Native Method: Server-side Rendering (GPU-based)

Global Product Data Interoperability Summit | 2021

Server-side Rendering:

- Get a beefy GPU box
- Stream pixels to device
- Render on server with OpenGL / Vulkan / WebGL etc
- Cost Implications (GPUs, servers etc)
- Security Implications (how sensitive are your pixels?)
- Scalability (number of concurrent users)

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

Sharding

Subdivide geometry & scenes into spatially compact shards

Enhances scalability, IP security, and enables wide-scale parallelism

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

Spatial Culling

View frustum, screen-size & occlusion culling

Enhances scalability & frame latency

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

Distributed Rendering

**Work is load-balanced
across many workers and
combined to produce final
composite image.**

Enables wide-scale parallelism
and fault-tolerance

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

- Unbounded scalability:
 - Concurrent users
 - Scene complexity
- Massively parallel
- Low latency
- Highly secure
 - SOC II compliant
 - Sensitive 3D data
- Fault-tolerance
- Ultra-low cost
 - CPU vs GPU
 - Adaptive load management

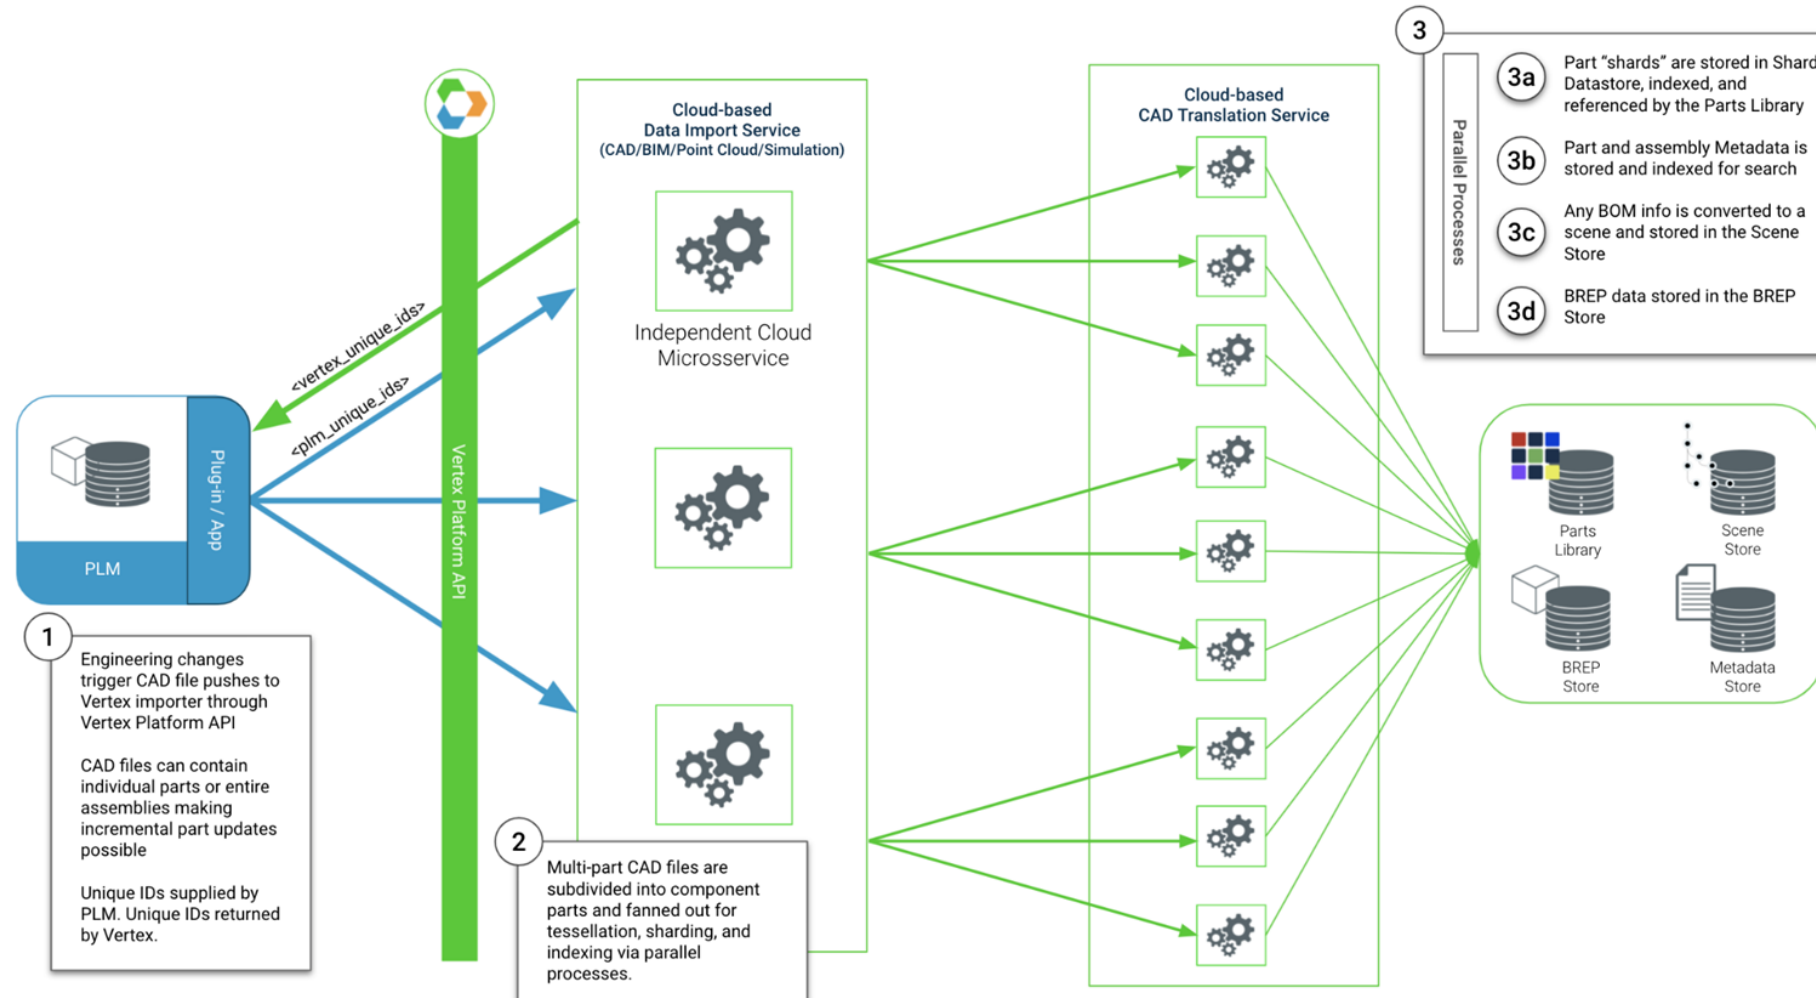

US Patent No. 10,950,044:

Methods and apparatus to facilitate 3D object visualization and manipulation across multiple devices

Issue Date: March 16, 2021

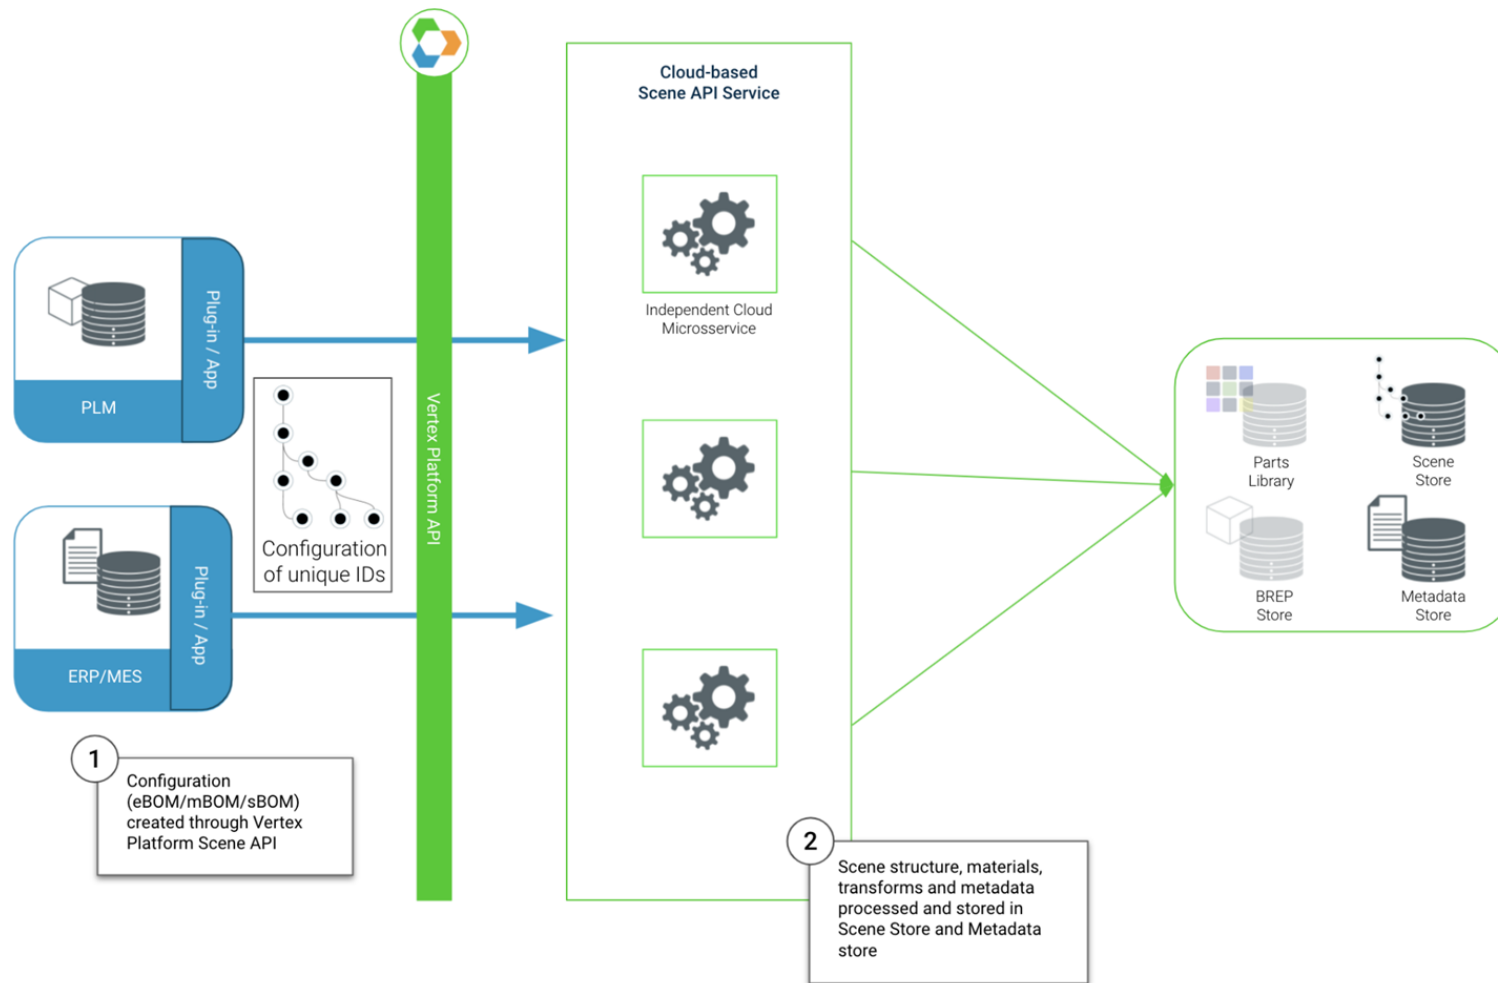

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

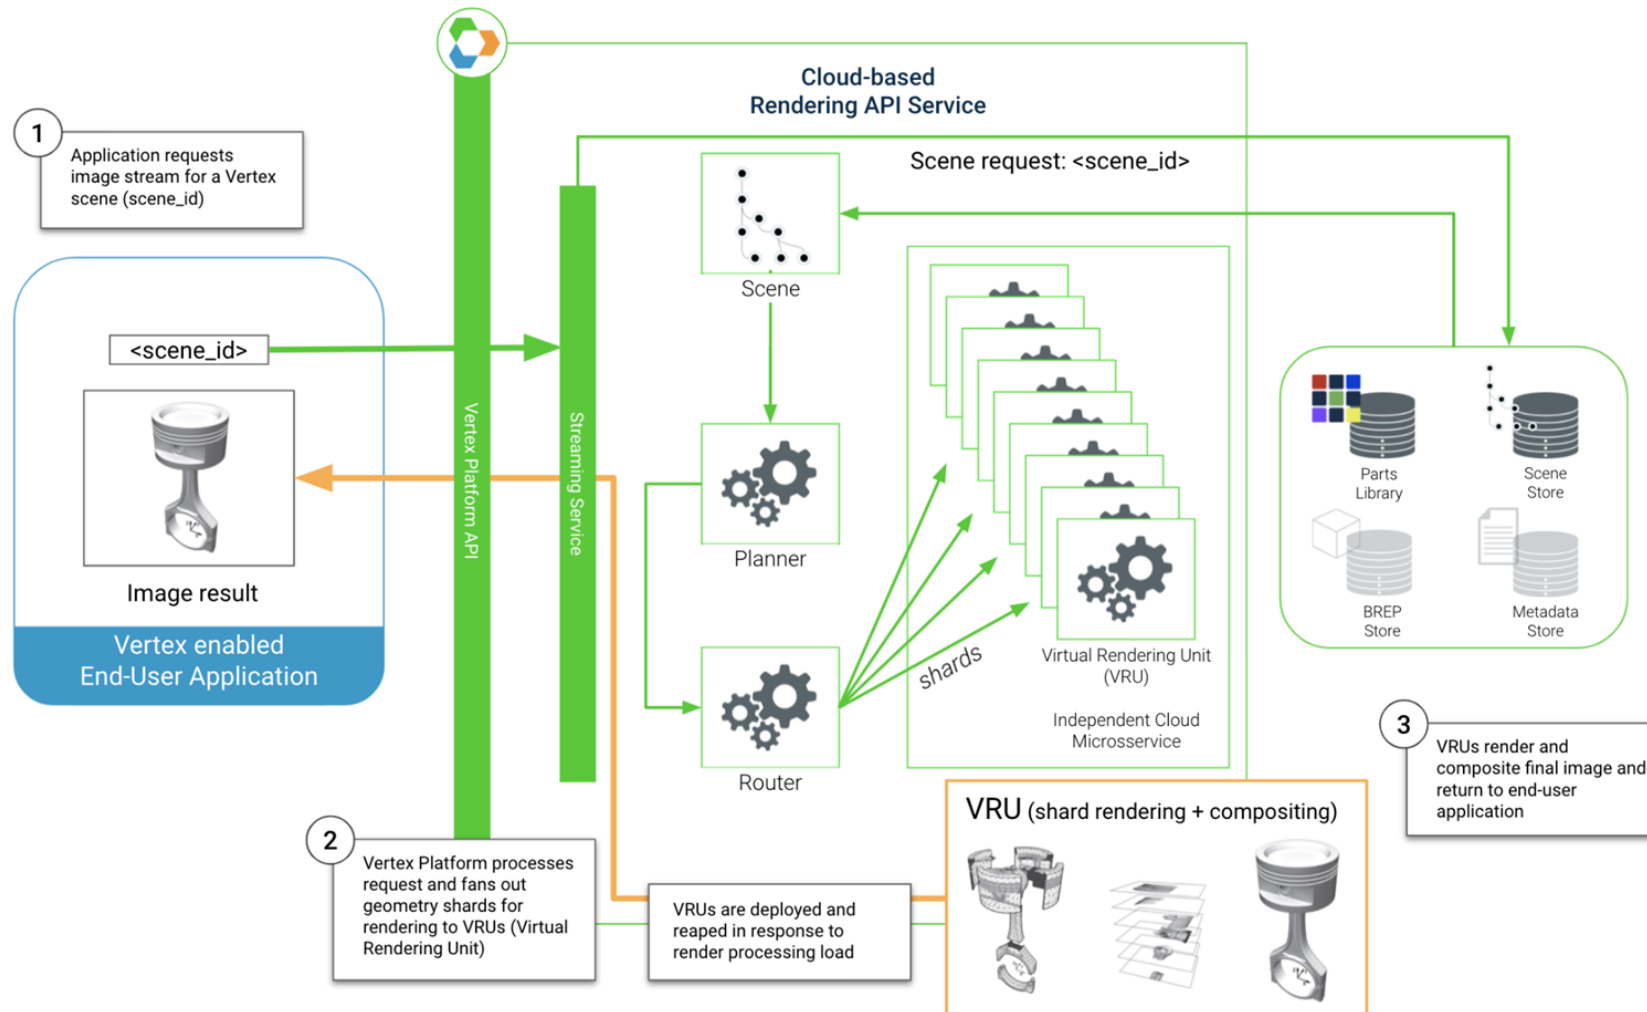

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

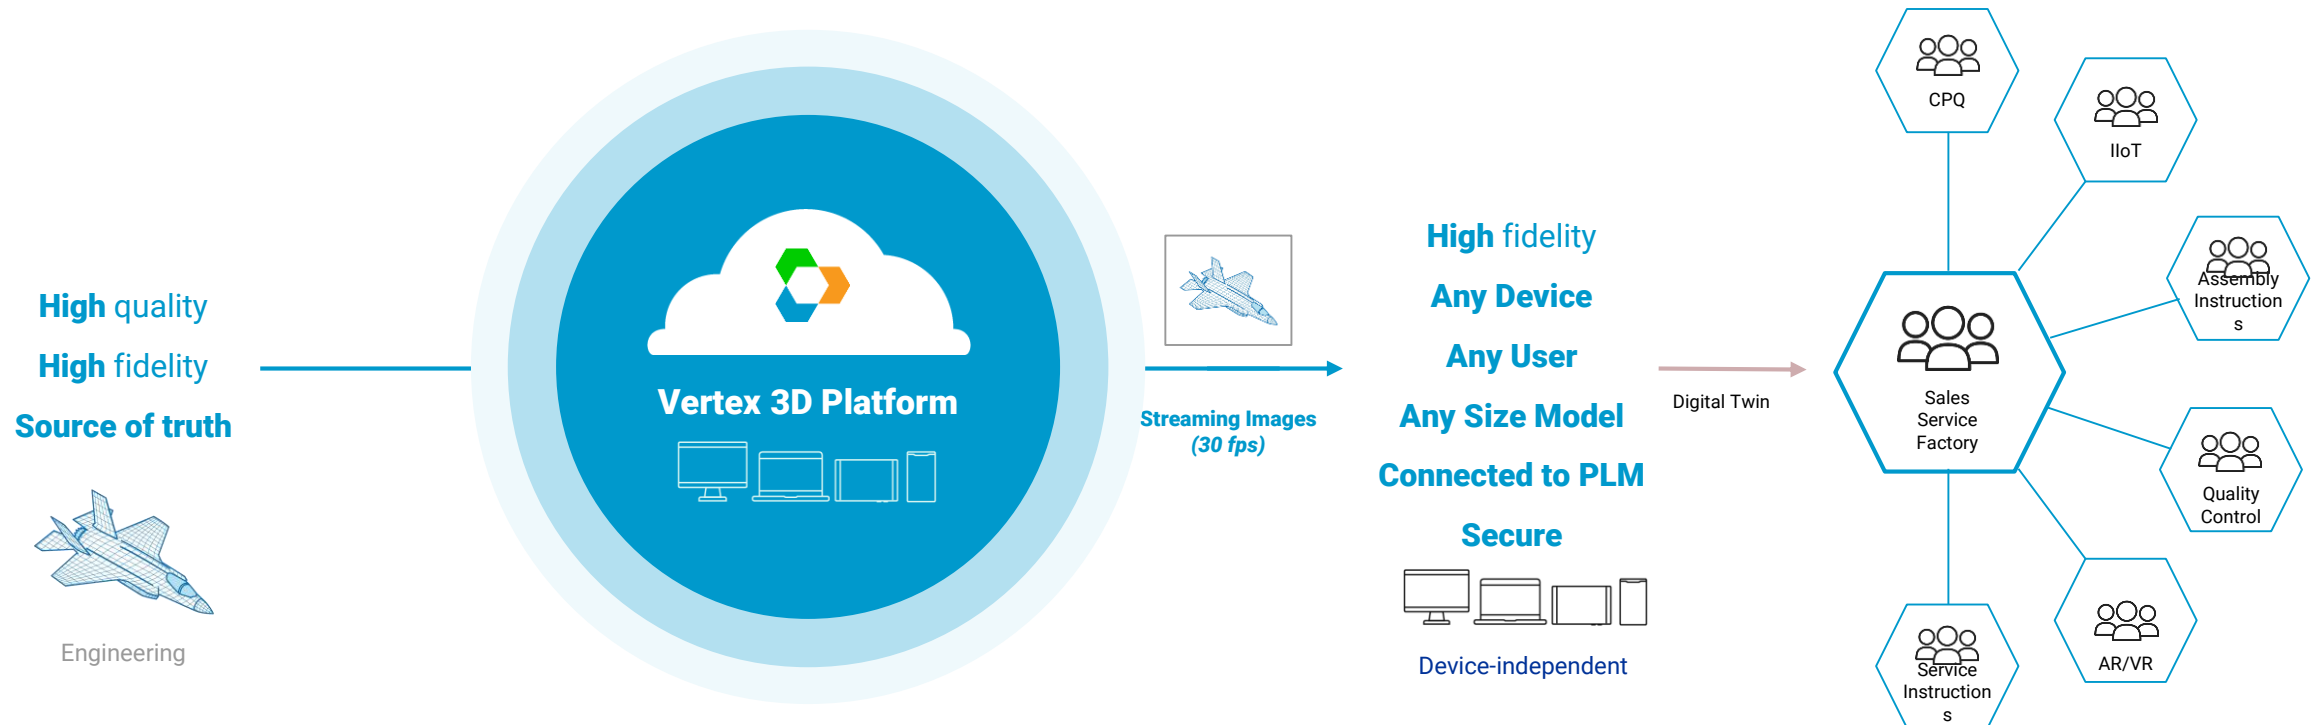

Cloud Native Method: Server-side Rendering (CPU-based)

Cloud Native Method: Server-side Rendering (CPU-based)

Global Product Data Interoperability Summit | 2021

Cloud Native Method: Server-side Rendering (CPU-based)

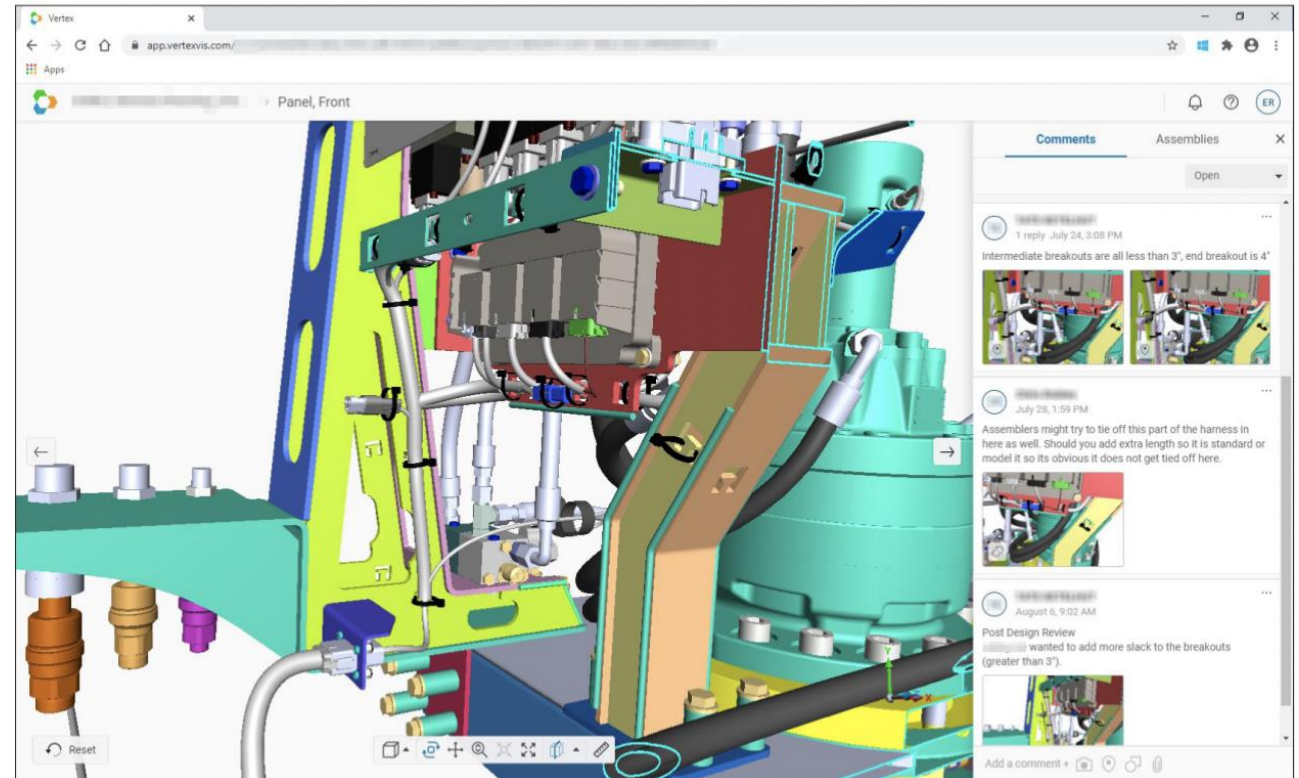

Global Product Data Interoperability Summit | 2021

Commercial Aviation model:

- File Size 1.3 GB compressed
- Model stats: 140K parts, 220M triangles
- Initial translation: ~4 minutes
- Load times: < 10 seconds

Load testing:

- 1,500 users = 210M parts, 330B triangles
- 3 hours with randomized camera views
- 15 frames per second per user

Digital Twin - Manufacturing - Electronic Work Instructions

Global Product Data Interoperability Summit | 2021

Challenge

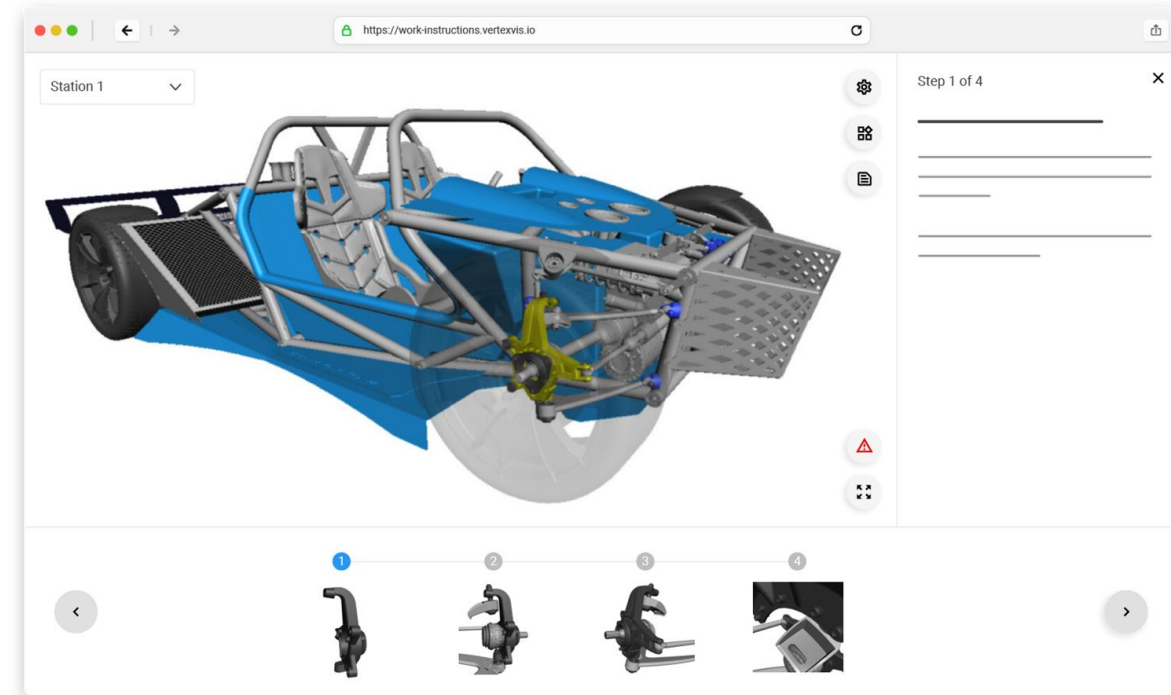

Static, out-of-date 2D work instructions disconnected from the product data, leading to wasted time, miscommunication, defects, and rework.

Solution

Digital twin-based instructions and MBD to the shop floor. Vertex enables shop floor operators and factory managers to virtual digital twins of product, fixtures, and tooling for use in up-to-date work instructions low-powered devices.

Benefits

- Improved takt time and increased quality by referencing a real-time virtual representation instead of a 2D drawing
- Improved understanding of process for highly custom and complex orders
- Close feedback loop between manufacturing and engineering
- Helps training and understanding for new personnel. Same work instructions can be leveraged for onboarding

Digital Twin - Manufacturing - Quality Reporting & Resolution

Global Product Data Interoperability Summit | 2021

Challenge

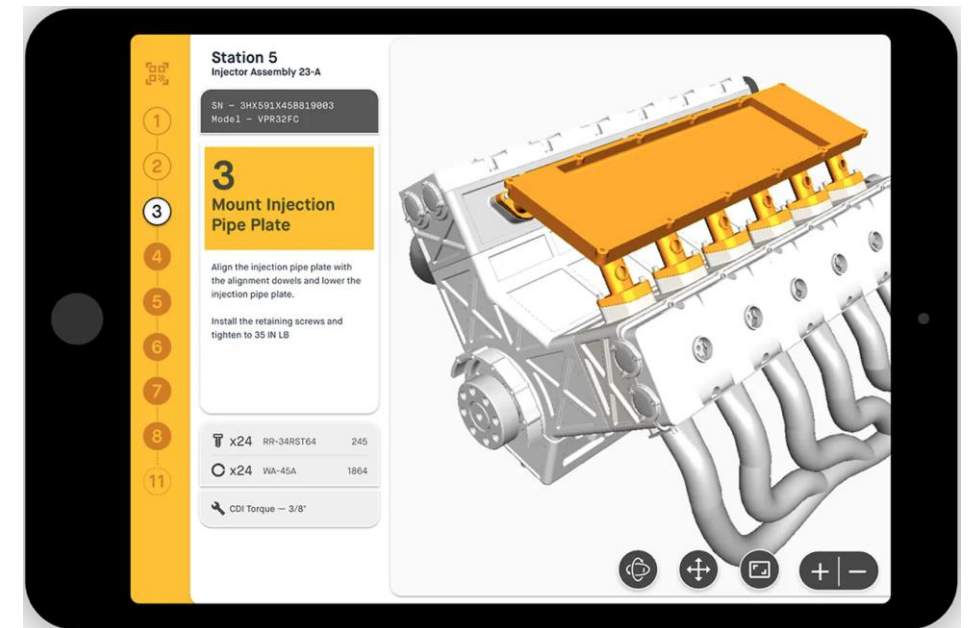

Manual data collection methods that rely on highly experienced personnel making it difficult to interpret, provide feedback and resolve quickly.

Solution

Quality Inspectors use virtual digital twins for creating pinpoint accuracy on issues automatically populated with work order, serial number, part number, and exact locations of issues.

Benefits

- Improved product and process quality through quantitative data on part defects
- Improved issue/defect identification, remediation time, and associated rework costs for manufacturing supervisors.
- Increased uptime for shop floor technicians, improving productivity
- Helps training and understanding for new personnel

Digital Twin - Smart Factory and Product IoT Visualization

Global Product Data Interoperability Summit | 2021

Challenge

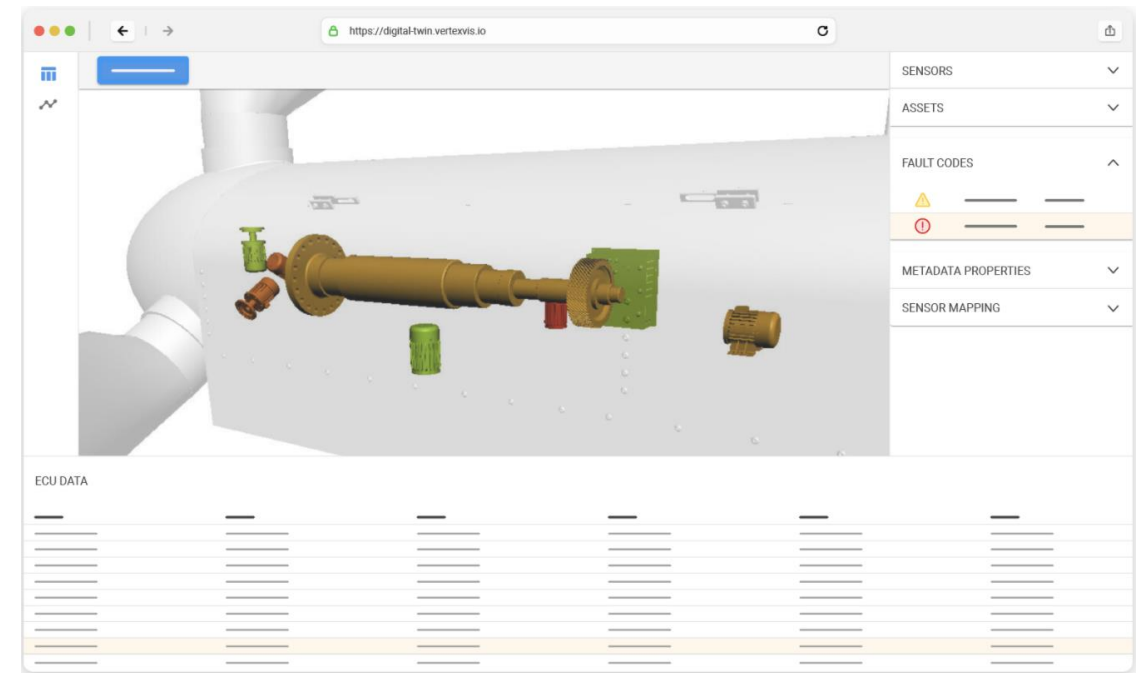

Factories and Connected Products collect vast amounts of telemetry, but the potential to gain insights from that data is largely unrealized by all departments

Solution:

Vertex integrates PLM, BIM, and IoT data sources to combine asset telemetry with actual 3D geometry to visualize IoT in-context along with other process data coming from MES and ERP.

Benefits

- Increased factory process insights to improve overall equipment efficiency
- Reduced feedback loop time for manufacturing process engineers
- Improved issue/defect identification/RCA and remediation time and associated rework costs for maintenance workers and manufacturing supervisors

Digital Twin - Enterprise Digital Thread Visualization

Global Product Data Interoperability Summit | 2021

Challenge

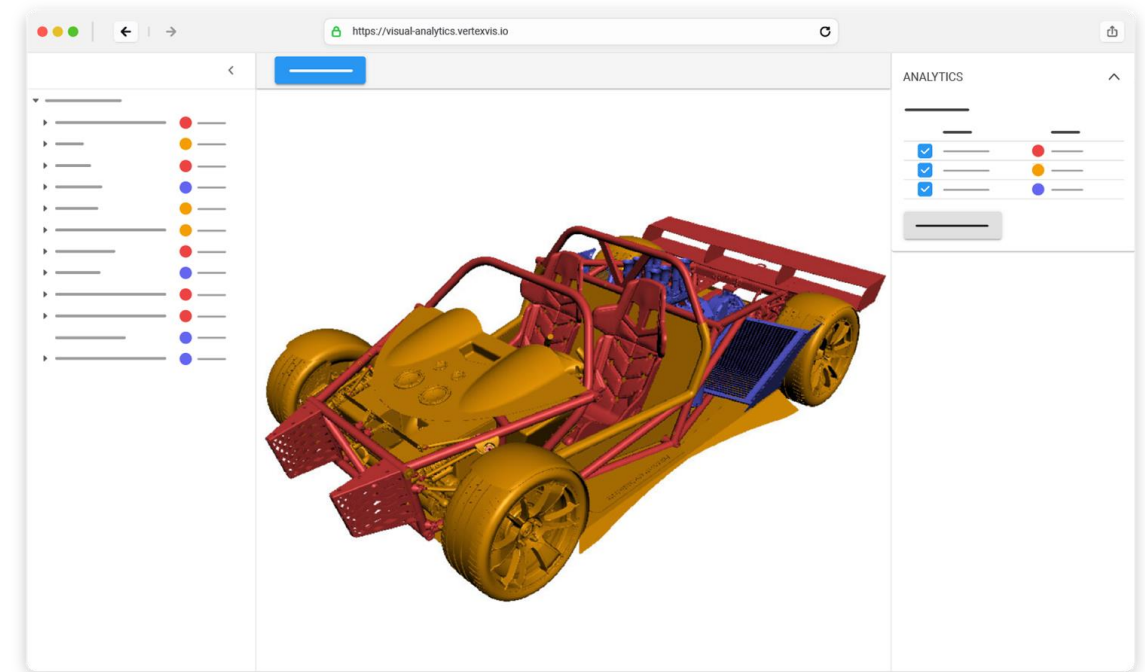

The digital thread contains a wealth of untapped information but it is often a tangled mess with siloed teams, databases, and knowledge. This data is often hard to contextualize based simply on configuration, part numbers, etc.

Solution

Develop digital twin applications connected to reports and queries from structured data warehouses and unstructured data lakes.

Benefits

- Data science is contextualized to the product and factory
- Understanding of data and insights is improved from the shop floor to the top floor

Thank you!
